Contents

1. Purpose
2. Method
3. Results
4. Considerations

1. Purpose

Develop long-range road snow control plans

Max. snow depth, Heavy snowfall, etc.

1. Estimate more accurately winter climate parameters for future projections using the global climate model
2. Apply this methodology for northern Japan to clarify the trends for future period changes

Winter Climate Parameters

1) Maximum snow depth

Road snow-control facilities are designed based on the 30-year annual max. snow depth

2) Maximum 24-hour snowfall

Width of the snow piling zone at the road shoulder is designed based on the 10-year max. daily snowfall

3) Frequency of 10 cm or more of daily snowfall

Snowplows are deployed to national highways when the depth of newly fallen snow reaches 10 cm and continuous snowfall is expected

2. Method

Key points

1. Weather data used
2. Adjustment process

Target Area

Northern Japan
<snowy
area>

Weather Data Used

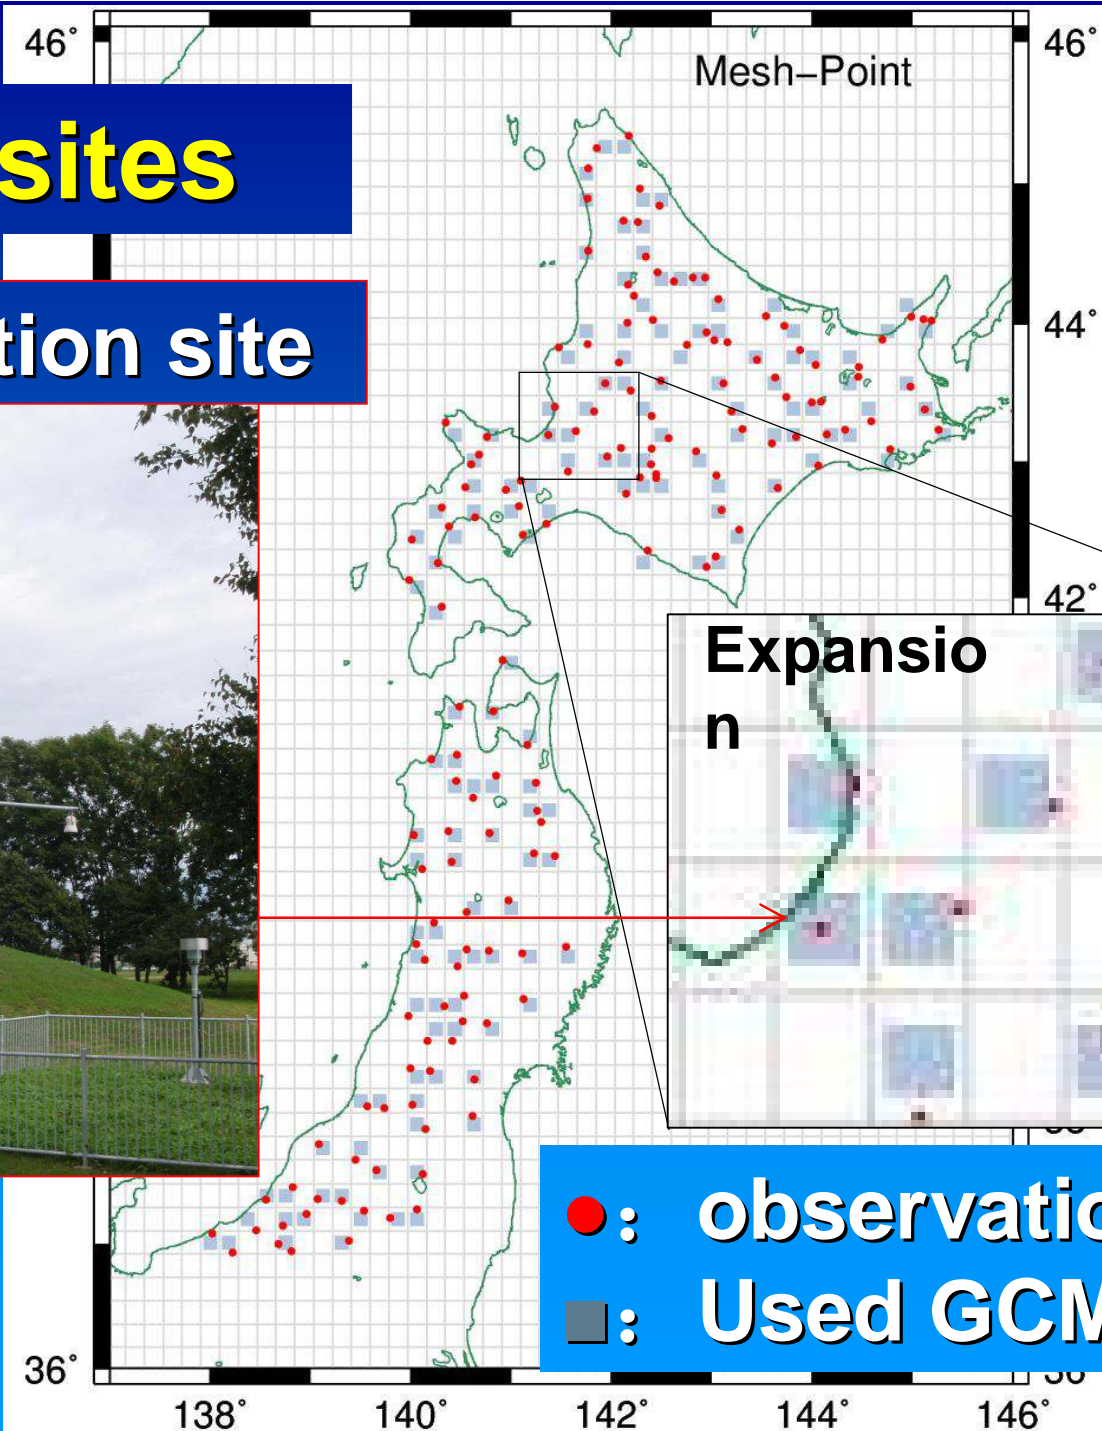

1) Snow depth data automatically measured every hour at 161 sites (1979-2002)

2) MRI-AGCM3.2S (Japan Meteorological Agency)

Resolution	Grid size: 20 km × 20 km		
Meteo rological Elements	Hourly	Daily	Monthly
	-Temperature -Precipitation	-Snow water equivalent	-Average snow depth
Period (Winter)	- Recent past (1979-2002) - Near future (2015-2038) - Century-end future (2075-2098)		
Greenhouse gas emissions scenario	A1B of IPCC		

161 sites

observation site

●: observation site
■: Used GCM data

Adjustment Process

Observed data of
3 climate parameters
<Observation sites>

MRI-AGCM data of
3 climate parameters
<Grid data 20 x 20km>

Recent past
1979-2002

Recent past
1979-2002

Near future
2015-2038

Century-end
2075-2098

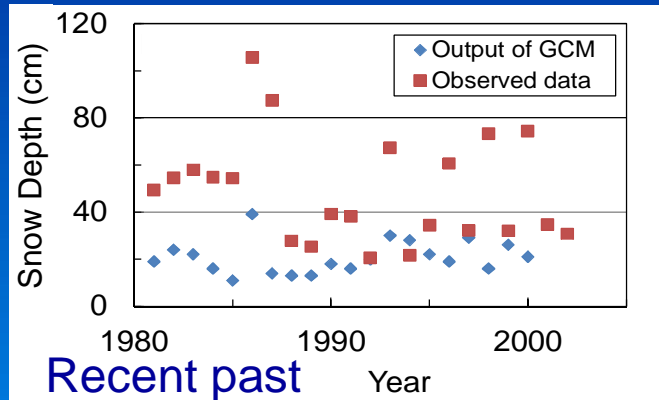

Adjustment formula
for 3 parameters at 161 sites

Future projections <Adjusted future values>

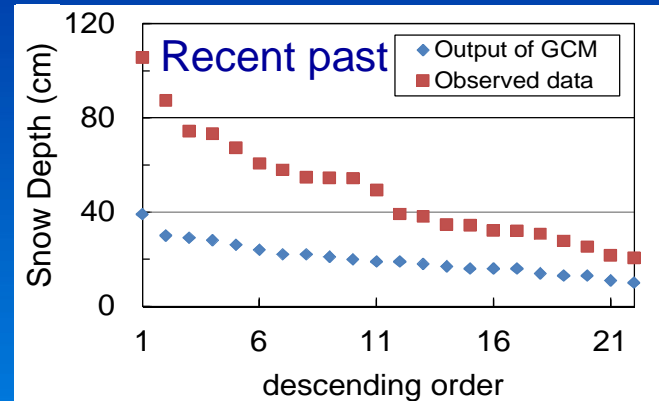

- Max. snow depth - Max. 24-hour snowfall
- Frequency of 10 cm or more of daily snowfall

Adjustment Formula

1) Extract the maximum snow depth for each winter.

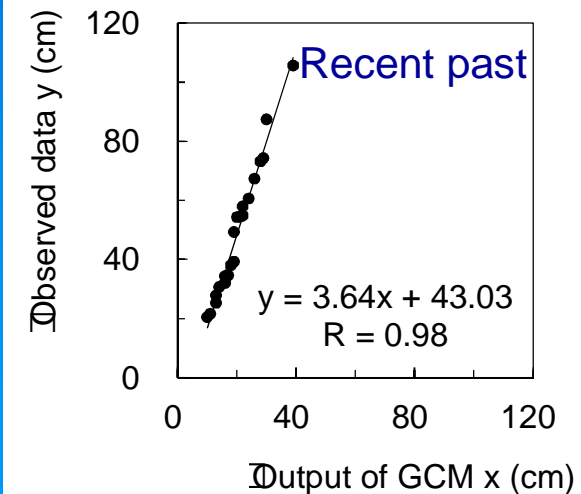

2) Sort the values extracted in descending order.

3) Generate an adjustment formula.

Max. snow depth
at Shinshinotsu site

3. Results

Differences in the average values for three climate parameters

- 1) Maximum snow depth
- 2) Maximum 24-hour snowfall
- 3) Frequency of daily snowfall of 10 cm or more

(1979-2002)**

4. Considerations

Affect of rising temperature on future winter climate parameters

Maximum 24-hour Snowfall

Predicted to decrease by only 0 to 10 cm

- > Current measures to mitigate the effects of heavy snowfall need to be secured at the same levels as today
- > Snow piling widths on roadsides need to be secured at those levels.

Frequency of Daily Snowfall of 10 cm or more

Expected to increase in central Hokkaido for the both future climate periods.

-> Deployment of snow removal vehicles may need to be reexamined.

Summary

1. Prediction Methodology
2. Future Trends Clarification
3. Projected winter climate parameters
4. Effect on Snow-Control Measures
